

Project Summary

Team name: Gradients of Galaxy

Team Members: Gauri Tike, Rucha Kulkarni

Challenge: **Personal CRM via LLM: Build Your Private, AI-Driven Networking Assistant**

LinkMate — Your AI Networking Companion

After networking events, hackathons, and conferences, we often walk away inspired—but with scattered notes, unread business cards, and forgotten connections. The problem? Following up is tedious, and existing CRM tools are too bulky or sales-focused for personal use.

LinkMate solves this with a lightweight, privacy-first AI assistant that turns contact chaos into meaningful connection. It helps users automatically extract names and affiliations from unstructured sources—like photos, business cards, and Excel sheets—then searches LinkedIn for matching profiles and drafts personalized connection requests. All this happens in one simple interface, with an intelligent memory layer that lets you ask, *“Who did I meet at DEF CON?”* or *“Who haven’t I followed up with from the AI Symposium?”*

Built during the hackathon, our working prototype includes:

- A **Smart Ingestion Engine** that processes images and documents to extract contact details
- A **LinkedIn Connector Agent** that generates thoughtful, event-aware messages
- A **Private CRM Builder** with a search interface and local data storage for privacy

Who benefits?

Anyone who values relationships: students, professionals, researchers, community organizers. LinkMate is built for people—not sales pipelines. This can also be integrated as LinkedIn feature to improve user experience and business growth.

What’s impressive?

Our demo runs on-device with small models and zero cloud dependencies, showing how accessible, secure AI can support real-world networking—without compromising privacy. With LinkMate, we reimagine relationship-building as effortless, personalized, and private. It’s your memory—augmented.
